## 1 Discrete Uniform Distribution

Abbreviation DiscUnif(n).
Type Discrete.
Rationale Equally likely outcomes.
Sample Space The interval 1, 2, $\ldots, n$ of the integers.
Probability Mass Function

$$
f(x)=\frac{1}{n}, \quad x=1,2, \ldots, n
$$

Moments

$$
\begin{aligned}
E(X) & =\frac{n+1}{2} \\
\operatorname{var}(X) & =\frac{n^{2}-1}{12}
\end{aligned}
$$

## 2 General Discrete Uniform Distribution

Type Discrete.
Sample Space Any finite set $S$.

Probability Mass Function

$$
f(x)=\frac{1}{n}, \quad x \in S,
$$

where $n$ is the number of elements of $S$.

## 3 Uniform Distribution

Abbreviation $\operatorname{Unif}(a, b)$.

Type Continuous.

Rationale Continuous analog of the discrete uniform distribution.
Parameters Real numbers $a$ and $b$ with $a<b$.

Sample Space The interval $(a, b)$ of the real numbers.
Probability Density Function

$$
f(x)=\frac{1}{b-a}, \quad a<x<b
$$

## Moments

$$
\begin{aligned}
E(X) & =\frac{a+b}{2} \\
\operatorname{var}(X) & =\frac{(b-a)^{2}}{12}
\end{aligned}
$$

Relation to Other Distributions $\operatorname{Beta}(1,1)=\operatorname{Unif}(0,1)$.

## 4 General Uniform Distribution

Type Continuous.

Sample Space Any open set $S$ in $\mathbb{R}^{n}$.

## Probability Density Function

$$
f(x)=\frac{1}{c}, \quad x \in S
$$

where $c$ is the measure (length in one dimension, area in two, volume in three, etc.) of the set $S$.

## 5 Bernoulli Distribution

Abbreviation $\operatorname{Ber}(p)$.
Type Discrete.

Rationale Any zero-or-one-valued random variable.

Parameter Real number $0 \leq p \leq 1$.

Sample Space The two-element set $\{0,1\}$.

## Probability Mass Function

$$
f(x)= \begin{cases}p, & x=1 \\ 1-p, & x=0\end{cases}
$$

## Moments

$$
\begin{aligned}
E(X) & =p \\
\operatorname{var}(X) & =p(1-p)
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are IID $\operatorname{Ber}(p)$ random variables, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{Bin}(k, p)$ random variable.

Degeneracy If $p=0$ the distribution is concentrated at 0 . If $p=1$ the distribution is concentrated at 1 .

Relation to Other Distributions $\operatorname{Ber}(p)=\operatorname{Bin}(1, p)$.

## 6 Binomial Distribution

Abbreviation $\operatorname{Bin}(n, p)$.
Type Discrete.
Rationale Sum of $n$ IID Bernoulli random variables.

Parameters Real number $0 \leq p \leq 1$. Integer $n \geq 1$.
Sample Space The interval $0,1, \ldots, n$ of the integers.

Probability Mass Function

$$
f(x)=\binom{n}{x} p^{x}(1-p)^{n-x}, \quad x=0,1, \ldots, n
$$

## Moments

$$
\begin{aligned}
E(X) & =n p \\
\operatorname{var}(X) & =n p(1-p)
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\operatorname{Bin}\left(n_{i}, p\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{Bin}\left(n_{1}+\cdots+n_{k}, p\right)$ random variable.

Normal Approximation If $n p$ and $n(1-p)$ are both large, then

$$
\operatorname{Bin}(n, p) \approx \mathcal{N}(n p, n p(1-p))
$$

Poisson Approximation If $n$ is large but $n p$ is small, then

$$
\operatorname{Bin}(n, p) \approx \operatorname{Poi}(n p)
$$

Theorem The fact that the probability mass function sums to one is equivalent to the binomial theorem: for any real numbers $a$ and $b$

$$
\sum_{k=0}^{n}\binom{n}{k} a^{k} b^{n-k}=(a+b)^{n}
$$

Degeneracy If $p=0$ the distribution is concentrated at 0 . If $p=1$ the distribution is concentrated at $n$.

Relation to Other Distributions $\operatorname{Ber}(p)=\operatorname{Bin}(1, p)$.

## 7 Hypergeometric Distribution

Abbreviation Hypergeometric $(A, B, n)$.

Type Discrete.
Rationale Sample of size $n$ without replacement from finite population of $B$ zeros and $A$ ones.

Sample Space The interval $\max (0, n-B), \ldots, \min (n, A)$ of the integers.
Probability Mass Function

$$
f(x)=\frac{\binom{A}{x}\binom{B}{n-x}}{\binom{A+B}{n}}, \quad x=\max (0, n-B), \ldots, \min (n, A)
$$

Moments

$$
\begin{aligned}
E(X) & =n p \\
\operatorname{var}(X) & =n p(1-p) \cdot \frac{N-n}{N-1}
\end{aligned}
$$

where

$$
\begin{align*}
p & =\frac{A}{A+B}  \tag{7.1}\\
N & =A+B
\end{align*}
$$

Binomial Approximation If $n$ is small compared to either $A$ or $B$, then

$$
\operatorname{Hypergeometric}(n, A, B) \approx \operatorname{Bin}(n, p)
$$

where $p$ is given by (7.1).

Normal Approximation If $n$ is large, but small compared to either $A$ or $B$, then

$$
\operatorname{Hypergeometric}(n, A, B) \approx \mathcal{N}(n p, n p(1-p))
$$

where $p$ is given by (7.1).
Theorem The fact that the probability mass function sums to one is equivalent to

$$
\sum_{x=\max (0, n-B)}^{\min (A, n)}\binom{A}{x}\binom{B}{n-x}=\binom{A+B}{n}
$$

## 8 Poisson Distribution

Abbreviation $\operatorname{Poi}(\mu)$
Type Discrete.
Rationale Counts in a Poisson process.
Parameter Real number $\mu>0$.
Sample Space The non-negative integers $0,1, \ldots$
Probability Mass Function

$$
f(x)=\frac{\mu^{x}}{x!} e^{-\mu}, \quad x=0,1, \ldots
$$

Moments

$$
\begin{aligned}
E(X) & =\mu \\
\operatorname{var}(X) & =\mu
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\operatorname{Poi}\left(\mu_{i}\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{Poi}\left(\mu_{1}+\cdots+\mu_{k}\right)$ random variable.

Normal Approximation If $\mu$ is large, then

$$
\operatorname{Poi}(\mu) \approx \mathcal{N}(\mu, \mu)
$$

Theorem The fact that the probability mass function sums to one is equivalent to the Maclaurin series for the exponential function: for any real number $x$

$$
\sum_{k=0}^{\infty} \frac{x^{k}}{k!}=e^{x}
$$

## 9 Geometric Distribution

Abbreviation $\operatorname{Geo}(p)$.

Type Discrete.

## Rationales

- Discrete lifetime of object that does not age.
- Waiting time or interarrival time in sequence of IID Bernoulli trials.
- Inverse sampling.
- Discrete analog of the exponential distribution.

Parameter Real number $0<p \leq 1$.

Sample Space The non-negative integers $0,1, \ldots$

## Probability Mass Function

$$
f(x)=p(1-p)^{x} \quad x=0,1, \ldots
$$

## Moments

$$
\begin{aligned}
E(X) & =\frac{1-p}{p} \\
\operatorname{var}(X) & =\frac{1-p}{p^{2}}
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are IID $\operatorname{Geo}(p)$ random variables, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{NegBin}(k, p)$ random variable.

Theorem The fact that the probability mass function sums to one is equivalent to the geometric series: for any real number $s$ such that $|s|<1$

$$
\sum_{k=0}^{\infty} s^{k}=\frac{1}{1-s}
$$

Degeneracy If $p=1$ the distribution is concentrated at 0 .

## 10 Negative Binomial Distribution

Abbreviation $\operatorname{NegBin}(r, p)$.

Type Discrete.

## Rationale

- Sum of IID geometric random variables.
- Inverse sampling.
- Gamma mixture of Poisson distributions.

Parameters Real number $0<p \leq 1$. Integer $r \geq 1$.

Sample Space The non-negative integers $0,1, \ldots$

Probability Mass Function

$$
f(x)=\binom{r+x-1}{x} p^{r}(1-p)^{x}, \quad x=0,1, \ldots
$$

Moments

$$
\begin{aligned}
E(X) & =\frac{r(1-p)}{p} \\
\operatorname{var}(X) & =\frac{r(1-p)}{p^{2}}
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\operatorname{NegBin}\left(r_{i}, p\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{NegBin}\left(r_{1}+\cdots+r_{k}, p\right)$ random variable.

Normal Approximation If $r(1-p)$ is large, then

$$
\operatorname{NegBin}(r, p) \approx \mathcal{N}\left(\frac{r(1-p)}{p}, \frac{r(1-p)}{p^{2}}\right)
$$

Degeneracy If $p=1$ the distribution is concentrated at 0 .
Extended Definition The definition makes sense for noninteger $r$ if binomial coefficients are defined by

$$
\binom{r}{k}=\frac{r \cdot(r-1) \cdots(r-k+1)}{k!}
$$

which for integer $r$ agrees with the standard definition.
Also

$$
\begin{equation*}
\binom{r+x-1}{x}=(-1)^{x}\binom{-r}{x} \tag{10.1}
\end{equation*}
$$

which explains the name "negative binomial."
Theorem The fact that the probability mass function sums to one is equivalent to the generalized binomial theorem: for any real number $s$ such that $-1<s<1$ and any real number $m$

$$
\begin{equation*}
\sum_{k=0}^{\infty}\binom{m}{k} s^{k}=(1+s)^{m} \tag{10.2}
\end{equation*}
$$

If $m$ is a nonnegative integer, then $\binom{m}{k}$ is zero for $k>m$, and we get the ordinary binomial theorem.

Changing variables from $m$ to $-m$ and from $s$ to $-s$ and using (10.1) turns (10.2) into

$$
\sum_{k=0}^{\infty}\binom{m+k-1}{k} s^{k}=\sum_{k=0}^{\infty}\binom{-m}{k}(-s)^{k}=(1-s)^{-m}
$$

which has a more obvious relationship to the negative binomial density summing to one.

## 11 Normal Distribution

## Abbreviation $\mathcal{N}\left(\mu, \sigma^{2}\right)$.

Type Continuous.

## Rationale

- Limiting distribution in the central limit theorem.
- Error distribution that turns the method of least squares into maximum likelihood estimation.

Parameters Real numbers $\mu$ and $\sigma^{2}>0$.
Sample Space The real numbers.

## Probability Density Function

$$
f(x)=\frac{1}{\sqrt{2 \pi} \sigma} e^{-(x-\mu)^{2} / 2 \sigma^{2}}, \quad-\infty<x<\infty
$$

## Moments

$$
\begin{aligned}
E(X) & =\mu \\
\operatorname{var}(X) & =\sigma^{2} \\
E\left\{(X-\mu)^{3}\right\} & =0 \\
E\left\{(X-\mu)^{4}\right\} & =3 \sigma^{4}
\end{aligned}
$$

Linear Transformations If $X$ is $\mathcal{N}\left(\mu, \sigma^{2}\right)$ distributed, then $a X+b$ is $\mathcal{N}\left(a \mu+b, a^{2} \sigma^{2}\right)$ distributed.

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\mathcal{N}\left(\mu_{i}, \sigma_{i}^{2}\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\mathcal{N}\left(\mu_{1}+\cdots+\mu_{k}, \sigma_{1}^{2}+\cdots+\sigma_{k}^{2}\right)$ random variable.

Theorem The fact that the probability density function integrates to one is equivalent to the integral

$$
\int_{-\infty}^{\infty} e^{-z^{2} / 2} d z=\sqrt{2 \pi}
$$

Relation to Other Distributions If $Z$ is $\mathcal{N}(0,1)$ distributed, then $Z^{2}$ is $\operatorname{Gam}\left(\frac{1}{2}, \frac{1}{2}\right)=\operatorname{chi}^{2}(1)$ distributed. Also related to Student $t$, Snedecor $F$, and Cauchy distributions (for which see).

## 12 Exponential Distribution

Abbreviation $\operatorname{Exp}(\lambda)$.
Type Continuous.

## Rationales

- Lifetime of object that does not age.
- Waiting time or interarrival time in Poisson process.
- Continuous analog of the geometric distribution.

Parameter Real number $\lambda>0$.
Sample Space The interval $(0, \infty)$ of the real numbers.

## Probability Density Function

$$
f(x)=\lambda e^{-\lambda x}, \quad 0<x<\infty
$$

Cumulative Distribution Function

$$
F(x)=1-e^{-\lambda x}, \quad 0<x<\infty
$$

Moments

$$
\begin{aligned}
E(X) & =\frac{1}{\lambda} \\
\operatorname{var}(X) & =\frac{1}{\lambda^{2}}
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are IID $\operatorname{Exp}(\lambda)$ random variables, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{Gam}(k, \lambda)$ random variable.

Relation to Other Distributions $\operatorname{Exp}(\lambda)=\operatorname{Gam}(1, \lambda)$.

## 13 Gamma Distribution

Abbreviation $\operatorname{Gam}(\alpha, \lambda)$.

Type Continuous.

## Rationales

- Sum of IID exponential random variables.
- Conjugate prior for exponential, Poisson, or normal precision family.

Parameter Real numbers $\alpha>0$ and $\lambda>0$.
Sample Space The interval $(0, \infty)$ of the real numbers.

## Probability Density Function

$$
f(x)=\frac{\lambda^{\alpha}}{\Gamma(\alpha)} x^{\alpha-1} e^{-\lambda x}, \quad 0<x<\infty
$$

where $\Gamma(\alpha)$ is defined by (13.1) below.
Moments

$$
\begin{aligned}
E(X) & =\frac{\alpha}{\lambda} \\
\operatorname{var}(X) & =\frac{\alpha}{\lambda^{2}}
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\operatorname{Gam}\left(\alpha_{i}, \lambda\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{Gam}\left(\alpha_{1}+\cdots+\alpha_{k}, \lambda\right)$ random variable.

Normal Approximation If $\alpha$ is large, then

$$
\operatorname{Gam}(\alpha, \lambda) \approx \mathcal{N}\left(\frac{\alpha}{\lambda}, \frac{\alpha}{\lambda^{2}}\right)
$$

Theorem The fact that the probability density function integrates to one is equivalent to the integral

$$
\int_{0}^{\infty} x^{\alpha-1} e^{-\lambda x} d x=\frac{\Gamma(\alpha)}{\lambda^{\alpha}}
$$

the case $\lambda=1$ is the definition of the gamma function

$$
\begin{equation*}
\Gamma(\alpha)=\int_{0}^{\infty} x^{\alpha-1} e^{-x} d x \tag{13.1}
\end{equation*}
$$

## Relation to Other Distributions

- $\operatorname{Exp}(\lambda)=\operatorname{Gam}(1, \lambda)$.
- $\operatorname{chi}^{2}(\nu)=\operatorname{Gam}\left(\frac{\nu}{2}, \frac{1}{2}\right)$.
- If $X$ and $Y$ are independent, $X$ is $\Gamma\left(\alpha_{1}, \lambda\right)$ distributed and $Y$ is $\Gamma\left(\alpha_{2}, \lambda\right)$ distributed, then $X /(X+Y)$ is $\operatorname{Beta}\left(\alpha_{1}, \alpha_{2}\right)$ distributed.
- If $Z$ is $\mathcal{N}(0,1)$ distributed, then $Z^{2}$ is $\operatorname{Gam}\left(\frac{1}{2}, \frac{1}{2}\right)$ distributed.

Facts About Gamma Functions Integration by parts in (13.1) establishes the gamma function recursion formula

$$
\begin{equation*}
\Gamma(\alpha+1)=\alpha \Gamma(\alpha), \quad \alpha>0 \tag{13.2}
\end{equation*}
$$

The relationship between the $\operatorname{Exp}(\lambda)$ and $\operatorname{Gam}(1, \lambda)$ distributions gives

$$
\Gamma(1)=1
$$

and the relationship between the $\mathcal{N}(0,1)$ and $\operatorname{Gam}\left(\frac{1}{2}, \frac{1}{2}\right)$ distributions gives

$$
\Gamma\left(\frac{1}{2}\right)=\sqrt{\pi}
$$

Together with the recursion (13.2) these give for any positive integer $n$

$$
\Gamma(n+1)=n!
$$

and

$$
\Gamma\left(n+\frac{1}{2}\right)=\left(n-\frac{1}{2}\right)\left(n-\frac{3}{2}\right) \cdots \frac{3}{2} \cdot \frac{1}{2} \sqrt{\pi}
$$

## 14 Beta Distribution

Abbreviation $\operatorname{Beta}\left(\alpha_{1}, \alpha_{2}\right)$.
Type Continuous.

## Rationales

- Ratio of gamma random variables.
- Conjugate prior for binomial or negative binomial family.

Parameter Real numbers $\alpha_{1}>0$ and $\alpha_{2}>0$.

Sample Space The interval $(0,1)$ of the real numbers.

## Probability Density Function

$$
f(x)=\frac{\Gamma\left(\alpha_{1}+\alpha_{2}\right)}{\Gamma\left(\alpha_{1}\right) \Gamma\left(\alpha_{2}\right)} x^{\alpha_{1}-1}(1-x)^{\alpha_{2}-1} \quad 0<x<1
$$

where $\Gamma(\alpha)$ is defined by (13.1) above.

## Moments

$$
\begin{aligned}
E(X) & =\frac{\alpha_{1}}{\alpha_{1}+\alpha_{2}} \\
\operatorname{var}(X) & =\frac{\alpha_{1} \alpha_{2}}{\left(\alpha_{1}+\alpha_{2}\right)^{2}\left(\alpha_{1}+\alpha_{2}+1\right)}
\end{aligned}
$$

Theorem The fact that the probability density function integrates to one is equivalent to the integral

$$
\int_{0}^{1} x^{\alpha_{1}-1}(1-x)^{\alpha_{2}-1} d x=\frac{\Gamma\left(\alpha_{1}\right) \Gamma\left(\alpha_{2}\right)}{\Gamma\left(\alpha_{1}+\alpha_{2}\right)}
$$

## Relation to Other Distributions

- If $X$ and $Y$ are independent, $X$ is $\Gamma\left(\alpha_{1}, \lambda\right)$ distributed and $Y$ is $\Gamma\left(\alpha_{2}, \lambda\right)$ distributed, then $X /(X+Y)$ is $\operatorname{Beta}\left(\alpha_{1}, \alpha_{2}\right)$ distributed.
- $\operatorname{Beta}(1,1)=\operatorname{Unif}(0,1)$.

## 15 Multinomial Distribution

Abbreviation $\operatorname{Multi}(n, \mathbf{p})$.

Type Discrete.

Rationale Multivariate analog of the binomial distribution.

Parameters Real vector $\mathbf{p}$ in the parameter space

$$
\begin{equation*}
\left\{\mathbf{p} \in \mathbb{R}^{k}: 0 \leq p_{i}, i=1, \ldots, k, \text { and } \sum_{i=1}^{k} p_{i}=1\right\} \tag{15.1}
\end{equation*}
$$

(real vectors whose components are nonnegative and sum to one).
Sample Space The set of vectors

$$
\begin{equation*}
S=\left\{\mathbf{x} \in \mathbb{Z}^{k}: 0 \leq x_{i}, i=1, \ldots, k, \text { and } \sum_{i=1}^{k} x_{i}=n\right\} \tag{15.2}
\end{equation*}
$$

(integer vectors whose components are nonnegative and sum to $n$ ).

## Probability Mass Function

$$
f(\mathbf{x})=\binom{n}{\mathbf{x}} \prod_{i=1}^{k} p_{i}^{x_{i}}, \quad \mathbf{x} \in S
$$

where

$$
\binom{n}{\mathbf{x}}=\frac{n!}{\prod_{i=1}^{k} x_{i}!}
$$

is called a multinomial coefficient.

## Moments

$$
\begin{aligned}
E\left(X_{i}\right) & =n p_{i} \\
\operatorname{var}\left(X_{i}\right) & =n p_{i}\left(1-p_{i}\right) \\
\operatorname{cov}\left(X_{i}, X_{j}\right) & =-n p_{i} p_{j}, \quad i \neq j
\end{aligned}
$$

Moments (Vector Form)

$$
\begin{aligned}
E(\mathbf{X}) & =n \mathbf{p} \\
\operatorname{var}(\mathbf{X}) & =n \mathbf{M}
\end{aligned}
$$

where

$$
\mathbf{M}=\mathbf{P}-\mathbf{p} \mathbf{p}^{T}
$$

where $\mathbf{P}$ is the diagonal matrix whose vector of diagonal elements is $\mathbf{p}$.

Addition Rule If $\mathbf{X}_{1}, \ldots, \mathbf{X}_{k}$ are independent random vectors, $\mathbf{X}_{i}$ being $\operatorname{Multi}\left(n_{i}, \mathbf{p}\right)$ distributed, then $\mathbf{X}_{1}+\cdots+\mathbf{X}_{k}$ is a $\operatorname{Multi}\left(n_{1}+\cdots+n_{k}, \mathbf{p}\right)$ random variable.

Normal Approximation If $n$ is large and $\mathbf{p}$ is not near the boundary of the parameter space (15.1), then

$$
\operatorname{Multi}(n, \mathbf{p}) \approx \mathcal{N}(n \mathbf{p}, n \mathbf{M})
$$

Theorem The fact that the probability mass function sums to one is equivalent to the multinomial theorem: for any vector a of real numbers

$$
\sum_{\mathbf{x} \in S}\binom{n}{\mathbf{x}} \prod_{i=1}^{k} a_{i}^{x_{i}}=\left(a_{1}+\cdots+a_{k}\right)^{n}
$$

Degeneracy If a vector a exists such that $\mathbf{M a}=0$, then $\operatorname{var}\left(\mathbf{a}^{T} \mathbf{X}\right)=0$.
In particular, the vector $\mathbf{u}=(1,1, \ldots, 1)$ always satisfies $\mathbf{M u}=0$, so $\operatorname{var}\left(\mathbf{u}^{T} \mathbf{X}\right)=0$. This is obvious, since $\mathbf{u}^{T} \mathbf{X}=\sum_{i=1}^{k} X_{i}=n$ by definition of the multinomial distribution, and the variance of a constant is zero. This means a multinomial random vector of dimension $k$ is "really" of dimension no more than $k-1$ because it is concentrated on a hyperplane containing the sample space (15.2).

Marginal Distributions Every univariate marginal is binomial

$$
X_{i} \sim \operatorname{Bin}\left(n, p_{i}\right)
$$

Not, strictly speaking marginals, but random vectors formed by collapsing categories are multinomial. If $A_{1}, \ldots, A_{m}$ is a partition of the set $\{1, \ldots, k\}$ and

$$
\begin{aligned}
Y_{j} & =\sum_{i \in A_{j}} X_{i},
\end{aligned} \quad j=1, \ldots, m
$$

then the random vector $\mathbf{Y}$ has a $\operatorname{Multi}(n, \mathbf{q})$ distribution.

Conditional Distributions If $\left\{i_{1}, \ldots, i_{m}\right\}$ and $\left\{i_{m+1}, \ldots, i_{k}\right\}$ partition the set $\{1, \ldots, k\}$, then the conditional distribution of $X_{i_{1}}, \ldots, X_{i_{m}}$ given $X_{i_{m+1}}, \ldots, X_{i_{k}}$ is $\operatorname{Multi}\left(n-X_{i_{m+1}}-\cdots-X_{i_{k}}, \mathbf{q}\right)$, where the parameter vector $\mathbf{q}$ has components

$$
q_{j}=\frac{p_{i_{j}}}{p_{i_{1}}+\cdots+p_{i_{m}}}, \quad j=1, \ldots, m
$$

## Relation to Other Distributions

- Each marginal of a multinomial is binomial.
- If $X$ is $\operatorname{Bin}(n, p)$, then the vector $(X, n-X)$ is $\operatorname{Multi}(n,(p, 1-p))$.

## 16 Bivariate Normal Distribution

Abbreviation See multivariate normal below.

Type Continuous.

Rationales See multivariate normal below.

Parameters Real vector $\boldsymbol{\mu}$ of dimension 2, real symmetric positive semidefinite matrix $\mathbf{M}$ of dimension $2 \times 2$ having the form

$$
\mathbf{M}=\left(\begin{array}{cc}
\sigma_{1}^{2} & \rho \sigma_{1} \sigma_{2} \\
\rho \sigma_{1} \sigma_{2} & \sigma_{2}^{2}
\end{array}\right)
$$

where $\sigma_{1}>0, \sigma_{2}>0$ and $-1<\rho<+1$.

Sample Space The Euclidean space $\mathbb{R}^{2}$.

Probability Density Function

$$
\begin{aligned}
f(\mathbf{x})= & \frac{1}{2 \pi} \operatorname{det}(\mathbf{M})^{-1 / 2} \exp \left(-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})^{T} \mathbf{M}^{-1}(\mathbf{x}-\boldsymbol{\mu})\right) \\
= & \frac{1}{2 \pi \sqrt{1-\rho^{2}} \sigma_{1} \sigma_{2}} \exp \left(-\frac{1}{2\left(1-\rho^{2}\right)}\left[\left(\frac{x_{1}-\mu_{1}}{\sigma_{1}}\right)^{2}\right.\right. \\
& \left.\left.-2 \rho\left(\frac{x_{1}-\mu_{1}}{\sigma_{1}}\right)\left(\frac{x_{2}-\mu_{2}}{\sigma_{2}}\right)+\left(\frac{x_{2}-\mu_{2}}{\sigma_{2}}\right)^{2}\right]\right), \quad \mathbf{x} \in \mathbb{R}^{2}
\end{aligned}
$$

## Moments

$$
\begin{aligned}
E\left(X_{i}\right) & =\mu_{i}, & i=1,2 \\
\operatorname{var}\left(X_{i}\right) & =\sigma_{i}^{2}, & i=1,2 \\
\operatorname{cov}\left(X_{1}, X_{2}\right) & =\rho \sigma_{1} \sigma_{2} & \\
\operatorname{cor}\left(X_{1}, X_{2}\right) & =\rho &
\end{aligned}
$$

Moments (Vector Form)

$$
\begin{aligned}
E(\mathbf{X}) & =\boldsymbol{\mu} \\
\operatorname{var}(\mathbf{X}) & =\mathbf{M}
\end{aligned}
$$

Linear Transformations See multivariate normal below.

Addition Rule See multivariate normal below.

Marginal Distributions $\quad X_{i}$ is $\mathcal{N}\left(\mu_{i}, \sigma_{i}^{2}\right)$ distributed, $i=1,2$.

Conditional Distributions The conditional distribution of $X_{2}$ given $X_{1}$ is

$$
\mathcal{N}\left(\mu_{2}+\rho \frac{\sigma_{2}}{\sigma_{1}}\left(x_{1}-\mu_{1}\right),\left(1-\rho^{2}\right) \sigma_{2}^{2}\right)
$$

## 17 Multivariate Normal Distribution

Abbreviation $\mathcal{N}(\boldsymbol{\mu}, \mathbf{M})$

Type Continuous.

## Rationales

- Multivariate analog of the univariate normal distribution.
- Limiting distribution in the multivariate central limit theorem.

Parameters Real vector $\boldsymbol{\mu}$ of dimension $k$, real symmetric positive semidefinite matrix $\mathbf{M}$ of dimension $k \times k$.

Sample Space The Euclidean space $\mathbb{R}^{k}$.

Probability Density Function If $\mathbf{M}$ is (strictly) positive definite,

$$
f(\mathbf{x})=(2 \pi)^{-k / 2} \operatorname{det}(\mathbf{M})^{-1 / 2} \exp \left(-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})^{T} \mathbf{M}^{-1}(\mathbf{x}-\boldsymbol{\mu})\right), \quad \mathbf{x} \in \mathbb{R}^{k}
$$

Otherwise there is no density ( $\mathbf{X}$ is concentrated on a hyperplane).
Moments (Vector Form)

$$
\begin{aligned}
E(\mathbf{X}) & =\boldsymbol{\mu} \\
\operatorname{var}(\mathbf{X}) & =\mathbf{M}
\end{aligned}
$$

Linear Transformations If $\mathbf{X}$ is $\mathcal{N}(\boldsymbol{\mu}, \mathbf{M})$ distributed, then $\mathbf{a}+\mathbf{B X}$, where $\mathbf{a}$ is a constant vector and $\mathbf{B}$ is a constant matrix of dimensions such that the vector addition and matrix multiplication make sense, has the $\mathcal{N}\left(\mathbf{a}+\mathbf{B} \boldsymbol{\mu}, \mathbf{B M B}^{T}\right)$ distribution.

Addition Rule If $\mathbf{X}_{1}, \ldots, \mathbf{X}_{k}$ are independent random vectors, $\mathbf{X}_{i}$ being $\mathcal{N}\left(\boldsymbol{\mu}_{i}, \mathbf{M}_{i}\right)$ distributed, then $\mathbf{X}_{1}+\cdots+\mathbf{X}_{k}$ is a $\mathcal{N}\left(\boldsymbol{\mu}_{1}+\cdots+\boldsymbol{\mu}_{k}, \mathbf{M}_{1}+\cdots+\mathbf{M}_{k}\right)$ random variable.

Degeneracy If a vector a exists such that $\mathbf{M a}=0$, then $\operatorname{var}\left(\mathbf{a}^{T} \mathbf{X}\right)=0$.
Partitioned Vectors and Matrices The random vector and parameters are written in partitioned form

$$
\begin{align*}
\mathbf{X} & =\binom{\mathbf{X}_{1}}{\mathbf{X}_{2}}  \tag{17.1a}\\
\boldsymbol{\mu} & =\binom{\boldsymbol{\mu}_{1}}{\boldsymbol{\mu}_{2}}  \tag{17.1b}\\
\mathbf{M} & =\left(\begin{array}{ll}
\mathbf{M}_{11} & \mathbf{M}_{12} \\
\mathbf{M}_{21} & \mathbf{M}_{2}
\end{array}\right) \tag{17.1c}
\end{align*}
$$

when $\mathbf{X}_{1}$ consists of the first $r$ elements of $\mathbf{X}$ and $\mathbf{X}_{2}$ of the other $k-r$ elements and similarly for $\boldsymbol{\mu}_{1}$ and $\boldsymbol{\mu}_{2}$.

Marginal Distributions Every marginal of a multivariate normal is normal (univariate or multivariate as the case may be). In partitioned form, the (marginal) distribution of $\mathbf{X}_{1}$ is $\mathcal{N}\left(\boldsymbol{\mu}_{1}, \mathbf{M}_{11}\right)$.

Conditional Distributions Every conditional of a multivariate normal is normal (univariate or multivariate as the case may be). In partitioned form, the conditional distribution of $\mathbf{X}_{1}$ given $\mathbf{X}_{2}$ is

$$
\mathcal{N}\left(\boldsymbol{\mu}_{1}+\mathbf{M}_{12} \mathbf{M}_{22}^{-}\left[\mathbf{X}_{2}-\boldsymbol{\mu}_{2}\right], \mathbf{M}_{11}-\mathbf{M}_{12} \mathbf{M}_{22}^{-} \mathbf{M}_{21}\right)
$$

where the notation $\mathbf{M}_{22}^{-}$denotes the inverse of the matrix $\mathbf{M}_{22}^{-}$if the matrix is invertible and otherwise any generalized inverse.

## 18 Chi-Square Distribution

Abbreviation $\operatorname{chi}^{2}(\nu)$ or $\chi^{2}(\nu)$.

Type Continuous.

## Rationales

- Sum of squares of IID standard normal random variables.
- Sampling distribution of sample variance when data are IID normal.
- Asymptotic distribution in Pearson chi-square test.
- Asymptotic distribution of log likelihood ratio.

Parameter Real number $\nu>0$ called "degrees of freedom."

Sample Space The interval $(0, \infty)$ of the real numbers.

## Probability Density Function

$$
f(x)=\frac{\left(\frac{1}{2}\right)^{\nu / 2}}{\Gamma\left(\frac{\nu}{2}\right)} x^{\nu / 2-1} e^{-x / 2}, \quad 0<x<\infty
$$

Moments

$$
\begin{aligned}
E(X) & =\nu \\
\operatorname{var}(X) & =2 \nu
\end{aligned}
$$

Addition Rule If $X_{1}, \ldots, X_{k}$ are independent random variables, $X_{i}$ being $\operatorname{chi}^{2}\left(\nu_{i}\right)$ distributed, then $X_{1}+\cdots+X_{k}$ is a $\operatorname{chi}^{2}\left(\nu_{1}+\cdots+\nu_{k}\right)$ random variable.

Normal Approximation If $\nu$ is large, then

$$
\operatorname{chi}^{2}(\nu) \approx \mathcal{N}(\nu, 2 \nu)
$$

## Relation to Other Distributions

- $\operatorname{chi}^{2}(\nu)=\operatorname{Gam}\left(\frac{\nu}{2}, \frac{1}{2}\right)$.
- If $X$ is $\mathcal{N}(0,1)$ distributed, then $X^{2}$ is $\operatorname{chi}^{2}(1)$ distributed.
- If $Z$ and $Y$ are independent, $X$ is $\mathcal{N}(0,1)$ distributed and $Y$ is $\operatorname{chi}^{2}(\nu)$ distributed, then $X / \sqrt{Y / \nu}$ is $t(\nu)$ distributed.
- If $X$ and $Y$ are independent and are $\operatorname{chi}^{2}(\mu)$ and $\operatorname{chi}^{2}(\nu)$ distributed, respectively, then $(X / \mu) /(Y / \nu)$ is $F(\mu, \nu)$ distributed.

## 19 Student's $t$ Distribution

Abbreviation $t(\nu)$.

Type Continuous.

## Rationales

- Sampling distribution of pivotal quantity $\sqrt{n}\left(\bar{X}_{n}-\mu\right) / S_{n}$ when data are IID normal.
- Marginal for $\mu$ in conjugate prior family for two-parameter normal data.

Parameter Real number $\nu>0$ called "degrees of freedom."
Sample Space The real numbers.

## Probability Density Function

$$
f(x)=\frac{1}{\sqrt{\nu \pi}} \cdot \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\Gamma\left(\frac{\nu}{2}\right)} \cdot \frac{1}{\left(1+\frac{x^{2}}{\nu}\right)^{(\nu+1) / 2}}, \quad-\infty<x<+\infty
$$

Moments If $\nu>1$, then

$$
E(X)=0
$$

Otherwise the mean does not exist. If $\nu>2$, then

$$
\operatorname{var}(X)=\frac{\nu}{\nu-2}
$$

Otherwise the variance does not exist.

Normal Approximation If $\nu$ is large, then

$$
t(\nu) \approx \mathcal{N}(0,1)
$$

## Relation to Other Distributions

- If $X$ and $Y$ are independent, $X$ is $\mathcal{N}(0,1)$ distributed and $Y$ is $\operatorname{chi}^{2}(\nu)$ distributed, then $X / \sqrt{Y / \nu}$ is $t(\nu)$ distributed.
- If $X$ is $t(\nu)$ distributed, then $X^{2}$ is $F(1, \nu)$ distributed.
- $t(1)=\operatorname{Cauchy}(0,1)$.

## 20 Snedecor's $F$ Distribution

Abbreviation $F(\mu, \nu)$.

Type Continuous.

## Rationale

- Ratio of sums of squares for normal data (test statistics in regression and analysis of variance).

Parameters Real numbers $\mu>0$ and $\nu>0$ called "numerator degrees of freedom" and "denominator degrees of freedom," respectively.

Sample Space The interval $(0, \infty)$ of the real numbers.

Probability Density Function

$$
f(x)=\frac{\Gamma\left(\frac{\mu+\nu}{2}\right) \mu^{\mu / 2} \nu^{\nu / 2}}{\Gamma\left(\frac{\mu}{2}\right) \Gamma\left(\frac{\nu}{2}\right)} \cdot \frac{x^{\mu / 2-1}}{(\mu x+\nu)^{(\mu+\nu) / 2}}, \quad 0<x<+\infty
$$

Moments If $\nu>2$, then

$$
E(X)=\frac{\nu}{\nu-2} .
$$

Otherwise the mean does not exist.

## Relation to Other Distributions

- If $X$ and $Y$ are independent and are $\operatorname{chi}^{2}(\mu)$ and $\operatorname{chi}^{2}(\nu)$ distributed, respectively, then $(X / \mu) /(Y / \nu)$ is $F(\mu, \nu)$ distributed.
- If $X$ is $t(\nu)$ distributed, then $X^{2}$ is $F(1, \nu)$ distributed.

## 21 Cauchy Distribution

Abbreviation Cauchy $(\mu, \sigma)$.
Type Continuous.

## Rationales

- Very heavy tailed distribution.
- Counterexample to law of large numbers.

Parameters Real numbers $\mu$ and $\sigma>0$.
Sample Space The real numbers.

## Probability Density Function

$$
f(x)=\frac{1}{\pi \sigma} \cdot \frac{1}{1+\left(\frac{x-\mu}{\sigma}\right)^{2}}, \quad-\infty<x<+\infty
$$

Moments No moments exist.
Addition Rule If $X_{1}, \ldots, X_{k}$ are IID Cauchy $(\mu, \sigma)$ random variables, then $\bar{X}_{n}=\left(X_{1}+\cdots+X_{k}\right) / n$ is also Cauchy $(\mu, \sigma)$.

## Relation to Other Distributions

- $t(1)=\operatorname{Cauchy}(0,1)$.

## 22 Laplace Distribution

Abbreviation Laplace $(\mu, \sigma)$.
Type Continuous.

Rationales The sample median is the maximum likelihood estimate of the location parameter.

Parameters Real numbers $\mu$ and $\sigma>0$, called the mean and standard deviation, respectively.

Sample Space The real numbers.
Probability Density Function

$$
f(x)=\frac{\sqrt{2}}{2 \sigma} \exp \left(-\sqrt{2}\left|\frac{x-\mu}{\sigma}\right|\right), \quad-\infty<x<\infty
$$

Moments

$$
\begin{aligned}
E(X) & =\mu \\
\operatorname{var}(X) & =\sigma^{2}
\end{aligned}
$$
